The Pros And Cons Of Cellulite Treatment Plastic Surgery

One of the more risky treatments for cellulite is to have cellulite treatment plastic surgery liposuction on your back, stomach, thighs, buttocks and neck. Many women hope these treatments will remove the subcutaneous fat tissue responsible for cellulite.

Known risks to cellulite treatment plastic surgery liposuction include the usual surgery suspects such as allergic response to the anesthesia, infection, blood clots and nerve damage. Other risks that are more closely associated with liposuction are friction burns, fluid accumulation and excessive fluid loss.

The cost of cellulite treatment plastic surgery liposuction varies greatly from surgeon to surgeon. It has the most cost variable of all the cosmetic surgeries. Some doctors structure their costs based on how much fat is suctioned during the surgery. Other surgeons structure the fees based on how many procedures are done during the surgery and still others use the time spent during the entire surgery.

There are also long term effects of cellulite treatment plastic surgery liposuction that include a browning of the skin around the site and an unevenness of the area after surgery. The most side effects happen from the newest procedure using ultrasound guided liposuction.

Cellulite treatment plastic surgery liposuction is a good procedure for women who want large bulges of fat tissue removed that won't disappear with weight loss or exercise. However, cellulite treatment plastic surgery liposuction is not a good option for those wishing to get rid of cellulite using surgery alone because it doesn't remove the fat at the subcutaneous level. People with large amounts of cellulite aren't good candidates for cellulite treatment plastic surgery liposuction because they can develop skin irregularities due to over or under correction of the localized fat deposits.

Cellulite treatment plastic surgery liposuction used in conjunction with other treatments such as Endermologie which is a non-invasive technique using a machine for creating skin folds using massage and suction. These folds utilize deep tissue mobilization to increase blood flow and lymphatic drainage.

Recovery from cellulite treatment plastic surgery liposuction used to take weeks or even months of pain. With the newest technology today healing is much quicker and some patients are able to return to work within days. Compression garments, often used in the recovery of severe burn patients, play an important role in the quick recovery of liposuction. In addition to helping the wound heal they often help to prevent blood clots.

Tumescent liposuction is a method that reduces invasion and allows for a much quicker recovery. Basically anesthetic, saline and adrenaline are injected directly under the skin. The anesthetic numbs the area while the adrenaline constricts the blood vessels and the saline enlarges the area in which the surgeon is working. Patients report less pain under a local anesthetic and less pain post-operatively.

If you are considering cellulite treatment plastic surgery liposuction discuss your options, risks, costs and benefits with a trusted surgeon. Get all the facts to determine if this type of treatment is right for you. Although liposuction may appear to be an easy fix on the surface, not all is what it appears to be.
